We should look into migrating to DNSSEC. Florian privately made some good experiences with core-networks.de (signing is super-easy, they just lack an API for zones which we haven't used anyways in the past).

There's a sponsoring offer on the table for backup DNS. An idea would be to have core-networks as main DNSSEC provider, and take advantage of the sponsoring offer as mirror/fallback (secondary zone with AXFR).

I'd start with less-prominent domains first to gain some experience. I would, contrary to the initial scope of the ticket, not consider hosting DNS on our own.
Not that urgent actually, shifting to Qlater
