Description

The XHP editor is good to enter in production, it will be nice to deploy it.

The editor is running at <https://newdesign.documentfoundation.org/xhpeditor/index.php> . Total space is less than 50M. No user files to store. PHP 7.x

The editor need access to the master Help git subproject. It can be either by cloning the submodule in the root of the webserver or a read-only symlink to the git repo.

If the helpcontent is to be cloned, a cron job must be set to pull the contents form the master Help repo periodically (e.g. 5 minutes)

Contents of the Help editor is in dev-tool/help3/xhpeditor/ git repo.
