Description

tb78 is down since one of the disks in the raid0 used for the bot is marked as failed (port#1 on the LSI controller)

The drive is an INTEL SSDSC2BA400G4
https://www.thomas-krenn.com/de/wiki/Intel_DC_S3710_Series_SSDs

The drive is listed with a 5 year warranty, and I think we ordered the server from Thomas-Krenn early in 2016 - so while it is a discontinued product, replacement should be covered under warranty. (Firmware version is G2010140 and that according to t-k wiki is from August 2015)
